

Setting Up **SSO** for Your Corporate Clients

A Simple Step-by-Step Guide

This guide walks you through connecting your client's company login system to your MergeTasks store. It takes about 10 minutes.

JUNE 2025 · CONFIDENTIAL

What Is SSO?

SSO stands for **Single Sign-On**. It lets your client's employees log into your store using the same username and password they use for their work email, Slack, and other company tools.

No separate passwords. No email codes. They just sign in with their work account and they're in.

Why Your Clients Will Love It

- Their employees don't need to create a new account or remember another password.
- When someone leaves the company, they're automatically locked out of the store.
- Their IT team stays in control — they manage access from their existing system.

Before You Start

You'll need one thing from your client: a quick conversation with whoever manages their company's login system. This is usually someone in their IT department.

Most companies use one of these systems: **Okta**, **Microsoft (Azure AD)**, **Google Workspace**, or **OneLogin**. Ask your client which one they use — that's all you need to know to get started.

What your client's IT person will need from you:

MergeTasks will give you two web addresses (URLs) to send to your client's IT person. You'll find these in Step 2 below. Just copy and paste them into an email.

1

Open Your Store's SSO Settings

Log into MergeTasks. Go to your store. Click on the **Settings** tab. You'll see a section called **SSO Connections** (or Single Sign-On). Click on it.

You'll see a page that says "No SSO connections yet." That's normal — we're about to add one.

If you don't see the SSO section, your plan may need to be upgraded to **Enterprise**. Contact MergeTasks support.

2

Add Your Client's Connection

Click the **Add Connection** button. You'll see a short form. Fill it in:

What to fill in	What to type
Connection name	Your client's company name (e.g., "Acme Corp")
Email domain	The part after the @ in their email (e.g., "acmecorp.com")
Type	Ask your client's IT person: "Do you use SAML or OIDC?" — they'll know

After you fill this in, MergeTasks will show you two web addresses. These are for your client's IT person.

Don't worry about what SAML and OIDC mean. Just ask your client's IT person — they'll immediately know which one their company uses.

3

Send the Details to Your Client's IT Person

Copy the two web addresses MergeTasks gave you in Step 2 and send them to your client's IT person. You can use the email template on the next page — just fill in the blanks.

Your client's IT person will spend about 15 minutes setting things up on their end. When they're done, they'll send you back a few pieces of information (either a URL and a certificate, or a URL, a Client ID, and a Client Secret).

You don't need to understand what these are — just paste them into MergeTasks in the next step.

Email Template

Copy and send to your client's IT person

Subject: Quick Setup — Employee Sign-In for Our Company Store

Hi [IT Person's Name],

We've set up an online company store where your employees can order branded merchandise — shirts, jackets, mugs, and more with your company logo.

To make it easy for your team, we'd like to connect the store to your company's login system so employees can sign in with their existing work credentials. No new passwords needed.

Could you set up a new app in your [Okta / Microsoft / Google] system with these details?

[Paste the two web addresses from MergeTasks here]

Once you've set it up, just send me back:

- The sign-in URL
- The certificate (for SAML) or the Client ID and Client Secret (for OIDC)

It usually takes about 15 minutes. Let me know if you have any questions!

Thanks,

[Your Name]

Just copy this entire email, replace the parts in **[brackets]** with the real information, and send it. That's it.

4

Paste What Your Client's IT Person Sends Back

When your client's IT person replies, they'll include a few pieces of information. Go back to MergeTasks, find the connection you created in Step 2, and click **Edit**.

Paste each piece of information into the matching field. The field names will match what your IT contact sent you.

When you're done, click **Save**.

5

Turn It On

You'll see a toggle switch next to your connection. Flip it to **Enabled**.

That's it. Every employee at your client's company with an @[domain] email address can now log into your store using their work credentials.

Test It

Try it yourself: go to your store's login page and type in an email address with your client's domain (e.g., jane@acmecorp.com). You should be redirected to their company login page. After signing in, you'll land back on the store, logged in.

If something doesn't work, the most common fix is to double-check that the URLs and certificate were pasted correctly. If it still doesn't work, ask your client's IT person to verify the setup on their end.

That's It — You're Done

Your client's employees can now log into your store with their work credentials.

Here's what you should know:

- If your client hires new employees, they'll be able to log in automatically — no setup needed on your end.
- If someone leaves the company and their IT team deactivates their account, they're automatically locked out of your store.
- You can add SSO connections for as many clients as you want. Each one is the same 5-step process.

Need Help?

Contact MergeTasks support at support@mergetasks.com and we'll walk you through it.
